Untertitel: A Simplified Approach to Alveolar Bone Reconstruction

Fachgebiet(e): Implantologie, Parodontologie

Kurztext:

This elaborately illustrated book takes a fresh look at alveolar bone reconstruction, positing that the vitality of the gingiva-alveolus-implant complex is more important than simple implant longevity. With the use of osteoperiosteal flaps, the surgeon manipulates available bone to recover what is missing in a very specific way: endosteally. This relatively closed wound approach seems to spontaneously activate the epigenetic signal within the gingivoalveolar complex, and the augmentation develops in a manner analogous to primordial growth. Soft tissue generally follows suit, and implant therapy can commence, creating a functional gingiva-alveolus-implant matrix.

Once mastered, bone flaps can almost entirely eliminate the need for block grafting or guided bone regeneration. The culmination of many years of clinical research, this volume presents procedures for various osteoperiosteal flaps. It is intended for the private practitioner who must use techniques that work consistently, minimize morbidity, and are simple and relatively quick to perform.
